37 # =====
38 # FUNCTION: I2C_InitSensorDriver
39 #
40 # DESCRIPTION:
41 #     This routine initializes the sensor I2C driver board on the DnB model
42 #     railroad. It sets parameters that are common to all sensor ports. The
43 #     I/O PI Plus board utilizes two MCP23017 chips. Each chip has two 8 bit
44 #     ports of configurable GPIO pins. Each chip is configured based on the
45 #     values in the %SensorChip hash.
46 #
47 #     Chip 3 is initialized for a 'Storm K Range' 4x4 keypad. MCP23017 GPIO
48 #     pins are direct connected as follows. Row (letter) GPIOs are set as
49 #     input + pullup. Columns set as outputs.
50 #
51 #     The %SensorChip{chip}{'Obj'} hash key is written with the driver object
52 #     pointer for use in sensor data reading.
53 #
54 #         Keypad pin:    1 2 3 4 5 6 7 8
55 #         Keypad col/row: A B 1 2 3 4 D C
56 #         GPIOA pin:    3 4 5 6 7 8 9 10
57 #         GPIOA bit:    0 1 2 3 4 5 6 7
58 #         GPIODIRA:    1 1 0 0 0 0 1 1      1 = Input, 0 = Output
59 #
60 # CALLING SYNTAX:

133
134# =====
135# FUNCTION: KeypadChildProcess
136#
137# DESCRIPTION:
138# This routine is launched as a child process during main program startup
139# and is used to return user input from the 'Storm K Range' 4x4 button
140# keypad. This keypad is connected to a MCP23017 port as follows.
141#
142#     row/col  1  2  3  4
143#             |  |  |  |
144#             A  -----0---1---2---3---
145#                   |  |  |  |
146#             B  -----4---5---6---7---
147#                   |  |  |  |
148#             C  -----8---9---A---B---
149#                   |  |  |  |
150#             D  -----C---D---E---F---
151#                   |  |  |  |
152#
153#     Keypad pin:  1 2 3 4 5 6 7 8
154#     Keypad col/row: A B 1 2 3 4 D C
155#     GPIOA pin:    3 4 5 6 7 8 9 10
156#     GPIOA bit:    0 1 2 3 4 5 6 7
157#     GPIODIRA:    1 1 0 0 0 0 1 1      1 = Input, 0 = Output
158#
159# A dedicated child process is used to improve the reliability of keypad
160# entries. Forks::Super is used between the parent and child to read data
161# from the child's STDERR filehandle. Do no other output to STDERR within
162# this routine. DisplayMessage and DisplayDebug are permitted since they
163# use STDOUT for messaging.
164#
165# The %KeypadData hash provides keypad specific data and state information.
166# Data is accessed using a hash index specified in the $Keypad variable.
167#
168# The %cols hash holds 4 values, each has one of the keypad column driver
169# bits low. These bits are configured as outputs by I2C_InitSensorDriver.
170# The %col hash keys map to the %matrix hash primary keys.
171#
172# The %matrix hash contains the resulting button value for each of the 16
173# combinations of col/row. I2C_InitSensorDriver configures the input pins
174# with pullup enabled which results in a value of 0xC3 when no button is
175# pressed. The hash secondary key corresponds to 0xC3 with one of the input
176# bits low. Input is ignored if multiple buttons are pressed.
177#
178# Note that the physical rotational orientation of the keypad, that is the
179# keys that are the top row, will necessitate changes to the %matrix hash
180# values. Current matrix values are for the orientation with the keypad
